

Downloading converted subtitles as a batch

Once a subtitling job has been started, there is a work file in Plint (JSON) which is used throughout the process. This file can be exported into a number of formats, for example within the editor or as an automated job. It can also be used "ad hoc".

In order to download multiple subtitles from the same project, at any point in time, just go to the **Download subtitles** page for the project. At the top of the page, first select a format, such as SRT or TTML. This will cause all downloaded files to first be converted into that format and packaged in a zip file.

You can then select to download just a single file (click on the corresponding cell), all files within a part or language, or all files on the project. As a final step you will get the option to only download files where one or more jobs are done.
